Introducción

Kinetic Alfvén Waves (KAWs) are right-handed polarized kinetic scale Alfvénic waves that propagate at quasi-perpendicular wave-normal angles [1, 2]. These waves are relevant for the study of space plasmas as they play a crucial role in several kinetic processes, such as the energy transfer from larger scales toward electron scales [3]. KAW have mainly been studied in electron-proton plasmas. However, space plasmas are constituted by a varied range of particle populations[4,5]. We analyze the dependence of the dispersion relation of KAWs on the density and plasma beta parameter of the different components in a magnetospheric-like plasma. By carrying out an extensive study of the dispersion properties of Alfvénic waves, we show that oxygen ions allow these waves to acquire right-hand polarization at lower angles than in the electron-proton plasma, enabling KAW to propagate at relatively low angles with respect to the geomagnetic field, which could explain satellite measurements in the ring current region [6].

Agradecimientos: Agradecemos el apoyo de la Agencia Nacional de Investigación y Desarrollo (ANID) a través de la Beca de Doctorado Nacional N° 21220616 (NVS), Proyecto FONDECYT Regular N° 1191351 (PSM) y Proyecto FONDECYT de Iniciación N° 11201048 (RAL).
